## Interview Task

The task should be solved as a Console / Terminal project for the reason that we want to see how you have resolved the problem at hand, and not spent any time resolving any UI.

Please develop an application that will parse the attached file (Navigation.csv), and present the content in the following manner:

The key points that should be achieved:

- The menu items should be indented depending on the parent they belong under.
- Some items are hidden, and should not be presented
- The items should be ordered alphabetically

NOTE: Please be aware that when testing your solution, we'll be using a different CSV file that is far longer and has few more depth levels.
